SUMMARY

Milk production on farms in 1950 totaled 120.6 billion pounds, 1 percent more than in 1949, but a billion pounds short of the record set in 1945. The number of milk cows on farms was about unchanged from the low level of 1949 while milk production per cow set a new high record of 5,292 pounds. Milk production per capita averaged 794 pounds, the second lowest since 1937. Numbers of young stock on hand for replacing milk cows increased and at the end of 1950 were the highest on record relative to cows. Among the manufactured dairy products output of Swiss cheese in 1950 set a new high and production of all types of cheese combined was only 2 percent short of the 1949 record. Creamery butter production was the second highest in the last half-dozen years, but only three-fourths as high as before World War II. More evaporated milk and dry whole milk were produced than in 1949, but output of non-fat dry milk solids was a tenth below the previous year's record. Ice cream production in 1950 was the smallest since the end of the war and about one-fourth below the 1946 peak. Prices paid by plants for both milk used for manufacturing purposes and milk used for fluid distribution turned up sharply in late 1950. For the year as a whole manufacturing milk averaged 2 percent higher than in 1949 but fluid milk was 4 percent lower. Milk distributors' sales of fluid whole milk in principal Federal administered markets in 1950 were 2 percent greater than in 1949, fluid cream sales were up  $1\frac{1}{2}$  percent, and fluid skim milk drinks up 7 percent.

The following Agricultural Statisticians are responsible for the preparation of this report: Milk cows and milk production, John L. Wilson, Ovide E. Grenier, and W. D. Blachly; Manufactured Dairy Products, W. D. Bormuth, I. E. Wissinger, and R. P. Matteson; Fluid milk markets, P. E. O'Donnell and Florence E. Fogelson. The work was under the direction of B. H. Bennett, Head, Division of Dairy Statistics.

## MILK COWS AND MILK PRODUCTION ON FARMS, 1950

Total production of milk on farms in the United States was 120.6 billion pounds in 1950, based on estimates for the 48 individual States released by the Bureau of Agricultural Economics today. Production was 1 percent above the revised 1949 total of 119.2 billion pounds, and was only 1 percent below the 1945 high of 121.5 billion pounds. Except for 1945, the 1950 production was higher than for any other year of record. The increased production over last year resulted from a 1 percent increase in milk production per cow to a new record high. The average number of milk cows on farms was essentially unchanged. The increase in milk production over 1949 failed to keep pace with the increase in the population of the United States with the result that per capita production was 1 percent lower than in 1949. Per capita production in 1950 was 2 percent below the 1925-39 average and 10 percent lower than the all-time high peak established in 1942 when milk production expanded rapidly under war-time demand. Estimates of annual milk production in the United States for 1950 and earlier years are shown in Table 1.

In seven of the twelve months of 1950, monthly milk production was higher than in the corresponding month of 1949 and in all months it was higher than the 1939-48 average. May production was lower than the corresponding month of 1949 because of slow development of new green feed caused by unseasonably cool weather over a wide area of the country. In four of the last six months of 1950, production fell below the high levels of a year earlier. Mild fall weather and excellent late pastures during October resulted in a record high flow of milk for the month. Estimates of United States monthly milk production are shown in Table 2; and data for the 29 States for which estimates are currently available may be found in Table 4.

The increased production during 1950 was general throughout most of the States, with all geographic regions showing some increase over 1949. Declines were registered by individual States in all regions, due almost entirely to reduced cow numbers. Among the more important dairy States the sharpest increase, 3 percent, occurred in New York. Production in Pennsylvania, Michigan, and California was up 2 percent and in Ohio it was up 1 percent. In Wisconsin and Iowa, production was essentially unchanged, while in Illinois it was down 1 percent and in Minnesota, down 2 percent. Of the States producing more than 5 billion pounds of milk, only Illinois and Minnesota showed a decrease. Estimates of annual milk production by States for 1950 are shown in Table 3.

Milk cow numbers were relatively stable in 1950 with no very clearcut trend up or down. For the year as a whole the annual average number was 22,779,000 head, slightly above the 1949 number of 22,745,000 head, and about 1 percent below the 1925-39 average of 22,952,000 head. Very high prices for meat animals exerted a steady pressure on dairymen to cull their herds rather closely. Offsetting this persistent pressure was the presence of abundant feed supplies on most farms and a desire to expand the livestock enterprise particularly in those areas of the country where acreage allotments of cash crops appeared likely to increase available forage.

In comparison with 1949, milk cow numbers were lower in four geographic regions and higher in two. Cow numbers were down about 1 percent in the West and West North Central and practically unchanged in the North Atlantic and East North Central. Numbers were up more than 2 percent in the South Atlantic and up 1 percent in the South Central. Among important dairy States, Indiana, Illinois, Minnesota and Iowa, each showed 2 percent decreases. Numbers in Pennsylvania, New York, Wisconsin and California changed less than 1 percent. On the other hand, Alabama numbers were up almost 5 percent and the following States showed 2 percent increases: Missouri, Virginia, Tennessee, and Mississippi. Numbers were up 1 percent in Michigan, Texas, and Kentucky.

Estimated milk production per cow for the year 1950 was 5,292 pounds -- the highest production per cow in the series of records beginning with 1924. This production was 1 percent higher than the 5,243 pounds per cow in 1949 and 21 percent higher than the 1925-39 average annual production of 4,379 pounds. The continued close culling of the recent years, improved breeding practices, good-pasture conditions over most States accompanied by heavy feeding of grain and other concentrates throughout the year all contributed to the record 1950 production per cow. Butterfat production per cow in 1950 was 211 pounds -- 1 percent above the 1949 figure of 209 pounds and 23 percent above the 1925-39 average. Milk production per cow in 1950 was at record high rates in 31 States, including some States in each major region, and was above 1949 in 33 States.

Farm inventories of cattle kept as milk stock at the beginning of 1951 showed about the same number of cows and heifers 2 years or more of age as a year earlier, 2 percent more heifers 1 to 2 years, and 8 percent more heifer calves under 1 year. The number of cows and heifers slaughtered under Federal inspection during 1950 was just slightly less than in 1949 but otherwise the lowest number since 1946. The number of cows and heifers 2 years old and over kept for milk on January 1, 1951 (including some heifers over 2 years of age but not yet fresh) totaled 24,579,000 head. The number of heifers 1 to 2 years of age being kept for milk cows totaled 5,692,000 head and heifer calves under 1 year of age being kept for milk cows, 7,394,000.

Table 1 - Milk Cows and Milk Production on Farms, United States,  
1925-39 Average and 1940-50

Year	Number of	Production per	Total milk production

1/ Centered on year b, including half of each January figure.

PRODUCTION, STOCKS, AND PRICES OF DAIRY PLANT PRODUCTS,  
1950

Output of butter, American cheese, ice cream, sweetened condensed whole milk (case goods), nonfat dry milk solids and dry buttermilk declined in 1950 from 1949, according to the Bureau of Agricultural Economics. On the other hand, production of several foreign varieties of cheese, evaporated whole milk, dry whole milk and sherbet showed gains in 1950 compared with 1949. Manufacturers' selling prices of sweetened condensed milk, both bulk and case, and dry buttermilk were higher in 1950 than in 1949, while prices of evaporated milk and spray-dried nonfat milk, dry whole milk, and plain condensed milk were unchanged or lower.

Creamery butter production in 1950 totaled 1,394,505,000 pounds, a decline of 1 percent from 1949 but a gain of 6 percent from the 1944-48 average. By months, output during the early part of the year was irregularly higher both from a year earlier and from the 5-year average, but was lower in the latter months. Production was lower in all regions except the West North Central and Mountain States where it was 3 and 11 percent higher, respectively. Declines ranged from 4 percent in the South Central States to 13 percent in the North Atlantic. Minnesota, Iowa, and Wisconsin still rank in that order as leaders in butter production and their combined output was 14 percent of the nation's 1950 total. Other important butter producing States in 1950 were Nebraska, Missouri, Illinois, Ohio, Michigan, Kansas, and North Dakota.

Total cheese production of 1,171,825,000 pounds for 1950 was down 2 percent from the record high of 1949, but was higher than that of any other year, except 1947. American cheese production declined 6 percent from 1949 to 1950 but, with the exception of Italian and Blue Mold cheese, other types of cheese registered gains.

Production of American cheese in 1950 was 882,850,000 pounds, down 6 percent from 1949 but up 3 percent from the 1944-48 average. Declines were shown in all geographic regions, except the Mountain States, and for all the important producing States, except Idaho. Wisconsin maintained an impressive lead in 1950 with 420,945,000 pounds or 48 percent of the nation's total. Other important cheese producing States in order of their rank were: Missouri, Minnesota, Illinois, Tennessee, New York, Indiana, Ohio, Michigan, Oregon, and Kentucky. Several States such as Illinois, Oklahoma and Minnesota have shown particularly sharp declines from 1949 to 1950.

Swiss cheese production in 1950 totaled 100,180,000 pounds. This exceeded the previous record output in 1949 by 24 percent and was 71 percent higher than the 1944-48 average. Combining the production of brick and Munster cheese for 1950, output totaled 32,265,000 pounds. This was the highest since 1940, a gain of 6 percent from a year earlier and 43 percent from the 1944-48 average. Output of Limburger cheese was 7,910,000 pounds, up 10 percent from 1949 but down 3 percent from the 5-year average. Cream cheese production was 59,130,000 pounds, the fourth highest of record, a gain of 9 percent from 1949 and 3 percent from the 1944-48 average. Neufchatel cheese production was 4,130,000 pounds for 1950, a gain of 2 percent from a year earlier but a decline of 52 percent from the 5-year average. Output of Italian cheese varieties totaled 53,680,000 pounds for 1950, down 3 percent from 1949 but up 2 percent from the 5-year average. Blue Mold cheese production was 7,050,000 pounds for 1950, the second lowest in 8 years of record, down 13 percent from 1949 and down 28 percent from the 1944-48 average. Production of unclassified varieties of cheese including part-skim American totaled 24,640,000 pounds, unchanged from 1949 but 25 percent below the 5-year average.

For the fourth successive year, ice cream production declined. The 1950 output was 539,775,000 gallons, 24 percent below the record high in 1946, down 3 percent from 1949 and 5 percent below the 5-year average. Production was lower than in 1949 in all regions except the Mountain and Pacific States. Of the 10 major producing States, all registered declines from 1949, except California and Texas where output was 3 percent and 1 percent higher, respectively. In the remainder of the 10 States declines ranged from 2 percent in Pennsylvania and Ohio to 9 percent in Illinois. The average annual butterfat content of ice cream has risen each year since 1946 -- from 11.71 percent in 1946 to 12.19 percent in 1950. Output of sherbet for 1950 was 15,970,000 gallons, the highest production since 1945, a gain of 18 percent from 1949. However, this total was still 47 percent below the 1944-48 average, as production was extremely large in 1944 and 1945 when wartime restrictions on ice cream encouraged the production of sherbet.

Evaporated whole milk production for 1950 was 2,884,800,000 pounds, up 5 percent from 1949 although lower than in any other year since 1940. Output of sweetened condensed whole milk was 63,740,000 pounds for 1950, the lowest since 1942 and down 37 percent from 1949. Production of condensed milk products (bulk goods) in 1950 were all higher than a year earlier except for sweetened condensed whole milk. Production of plain condensed whole milk totaled 237,600,000 pounds for 1950, a new high record and up 18 percent from 1949. A record high output was also shown by plain condensed skim milk. At 550,000,000 pounds, it was 3 percent higher than in 1949. Output of sweetened condensed whole milk totaled 46,275,000 pounds, down 4 percent from 1949 and

the lowest for any year since 1935 except for 1948. Production of sweetened condensed skim milk in 1950 totaled 220,300,000 pounds, up 1 percent from 1949. However, except for 1949, output was the lowest since 1941.

Manufacturers' stocks of evaporated milk at the end of each month during 1950 were lower than a year earlier. Declines from a year earlier ranged from 5 percent on November 30 to 51 percent at the end of both February and March. Holdings of sweetened condensed whole milk were lower than a year earlier for the first 8 months of 1950. At the end of September, October and November, stocks were sharply higher than a year earlier but at the end of December, they were again somewhat lower.

The selling price of evaporated milk for the year of 1950 was unchanged from 1949 at \$5.23 per case of 48 14 $\frac{1}{2}$ -oz. cans. This annual average price has been exceeded only by 1947 and 1948 during the past quarter century. Prices of sweetened condensed whole milk averaged \$9.25 per case of 48 14-oz. cans during 1950, the second highest price in a quarter century and 8 cents above 1949. Prices of both evaporated and condensed case goods declined during 1949, held a low level through early 1950 and then rose considerably in the last 6 months of 1950. Selling price of plain condensed bulk goods averaged lower in 1950 than in 1949 while prices of the sweetened products were higher. Prices of plain condensed whole milk averaged \$12.35 per hundredweight for 1950, a decline of 43 cents from 1949 and the lowest annual average since 1947. Plain condensed skim milk prices averaged \$3.81 per hundredweight for 1950, the lowest annual average since 1942 and down 8 cents from 1949. Prices of sweetened condensed whole milk averaged \$14.21 per hundredweight for 1950, a gain of 12 cents from 1949. An average price of \$8.28 per hundredweight for sweetened condensed skim milk was received by manufacturers, a gain of 26 cents from 1949.

Production of total nonfat dry milk solids during 1950 was 844,880,000 pounds, 10 percent below the record high of 1949 but higher than for any other year in 16 years of record. Spray-dried nonfat milk production for 1950 was 591,900,000 pounds, down 6 percent from 1949 but also the second highest in 8 years of record. On the other hand, roller-dried nonfat milk production was the second lowest in 8 years of record. The record low was established in 1948. At 252,980,000 pounds, roller-dried nonfat was down 17 percent from 1949. Production of dry skim milk for animal feed was 20,010,000 pounds for 1950, a decline of 6 percent from 1949. The 1950 output of dry whole milk was 128,755,000 pounds, a gain of 3 percent from 1949 but lower than any other year since 1942. Dry buttermilk production was 44,865,000 pounds for 1950, down 9 percent from 1949 and 3 percent from the 1944-48 average.

In all months of 1950, manufacturers' stocks of total nonfat dry milk solids were lower than a year earlier. In the latter months of the year, stocks were the lowest for the date since 1947. Both roller and spray process stocks followed much the same pattern compared with a year earlier that was shown by total nonfat solids. Holdings of dry whole milk during 1950 were lower on all dates than on the corresponding dates of 1949. Dry buttermilk stocks were lower at the end of each month during 1950 than a year earlier.

Selling prices of total nonfat dry milk solids averaged 11.91 cents per pound during 1950 compared with 11.95 cents in 1949 and 15.10 cents for 1948. Prices of spray-dried nonfat averaged 12.40 cents per pound, unchanged from 1949. In the 6 years for which data on spray-dried nonfat were available, 1947 was the only year in which prices were lower than the 1950 price. Prices for roller-process averaged 10.61 cents per pound for 1950 compared with 10.92 cents for 1949.

Selling prices of dry whole milk in 1-2 $\frac{1}{2}$  pound packages averaged 43.99 cents per pound for 1950 compared with 47.20 cents in 1949. In 5 pound packages, prices averaged 39.77 cents per pound for 1950, 43.20 cents for 1949, and 48.51 cents for 1948. In all other packages, mostly bulk, prices averaged 33.98 cents per pound, compared with 33.79 cents for 1949 and 43.01 cents for 1948. Dry whole milk in all packages averaged 37.51 cents for 1950, 40.25 cents for 1949, and 47.31 cents for 1948.

Prices paid for manufacturing milk during 1950, at a test of 3.97 percent, averaged \$3.21 per hundredweight for the entire year compared with \$3.14 for milk of 3.96 percent butterfat for 1949. During January and February 1950, prices of manufacturing milk were lower than for the corresponding months of 1949 but during the remaining months of 1950, prices exceeded those of a year earlier. By December 1950, the price had reached \$3.77 per hundredweight or a gain of 43 cents over the same month of 1949. This manufacturing milk price series is developed by weighting the price of milk used in butter and by-products, American cheese and evaporated milk.

Milk purchased for use in butter and by-products averaged \$3.18 per hundredweight for 1950 compared with \$3.14 for 1949. Prices were lower than a year earlier during January and February 1950 but were higher during the remainder of the year. The average price per pound of butterfat was 82 cents during January and February and declined to 78 cents in May and June but gradually rose until it reached 91 cents in December 1950. Butterfat tests of this milk varied from 3.93

(Continued on page 50)

FLUID MILK AND CREAM MARKET STATISTICS

The milk dealers' average buying price in 1950 was lower than in 1949 but the average relationship of prices for the two years obscures the sharp change which occurred during the year. In January of 1950 the milk dealers' average buying price was 51 cents per hundredweight below the price in January 1949. As the year progressed this margin gradually diminished. By September it had shrunk to 9 cents per hundredweight. In October a substantial increase wiped out the 9 cent minus margin and raised the price 5 cents per hundredweight above October 1949. By December the plus margin had increased to 13 cents and in January of 1951 the margin increased to 33 cents above January 1950. It should be noted, however, that despite the greater than seasonal rise in this price after June 1950 and the large contraseasonal rise in January 1951 it was still below the levels of January 1948 and January 1949. Comparative prices for these three periods were: January 1948, \$5.09; January 1949, \$5.16; and January 1951, \$4.98.

Retail prices for standard milk delivered to homes in 25 major cities in 1950 averaged 19.9 cents per quart. This was three-tenths of one cent lower than in

(Continued on page 48)

1/ Data for Cincinnati, Columbus, Dayton-Springfield, Louisville, Nashville, Philadelphia, St. Louis, and South Bend-La Port show total sales, both in and outside the marketing area. In-area sales only are not yet available for both fluid milk and fluid cream in these markets.						
2/ Includes sweet and sour cream and milk and cream mixtures containing 6% butterfat or more.						
3/ Sales data are not segregated by handlers in terms of inside or outside the "Marketing Area." The sales data as shown here represent total sales for the Metropolitan Area.						

Compiled from reports of Federal Milk Market Administrators, through tie cooperation of the Dairy Branch, P.M.A. with funds made available under the Research and Marketing Act.

Table 61-Daily Average Sales of Fluid Whole Milk, Skim Milk Items and Butterfat in Fluid Cream,  
in Certain Marketing Areas <sup>1/</sup> under Federal Orders for 1948, 1949, and 1950

* Computed from unrounded figures.												

<sup>1/</sup> Product sold on routes outside of marketing areas included, except where noted.

Federal order are not always included in data for market in which distributed.

<sup>2/</sup> Includes sweet and sour cream and milk and cream mixtures containing 6 percent or more butterfat.

<sup>3/</sup> Includes fluid items such as plain and flavored skim milk and buttermilk which do not meet the butterfat content requirement for whole milk and flavored whole milk. <sup>4/</sup> Preliminary. <sup>5/</sup> No significant quantities of outside sales included.

<sup>6/</sup> Includes items sold in the Metropolitan District.

<sup>7/</sup> Includes all whole milk and all skim milk items shipped into marketing area; flavored milk drinks made from concentrated dairy products or from whole milk separated in city plants are not included.

<sup>8/</sup> Does not include storage cream. <sup>9/</sup> Includes all cream disposed of outside the marketing area. <sup>10/</sup> Revised.

<sup>11/</sup> Sales data for the Minneapolis-St. Paul, Minn., and the New Orleans, La., areas excluded for purposes of comparison.

<sup>12/</sup>

1949. In January 1950 the average retail price for this sample of cities was one and one-tenth cents per quart below the average price in January 1949. This negative margin diminished steadily until September 1950 when it disappeared. In October 1950 the average price was four-tenths cent per quart higher than a year earlier. In November the margin increased to six-tenths cent per quart and in December to eight-tenths cent per quart. In January 1951 the average price was one and four-tenths cents per quart higher than in January 1950 and the price, 21.4 cents per quart, was the highest of record for January. The highest price of record for any month, 21.6 cents per quart, occurred in September through November 1948 when the peak to date of Class I and retail milk prices was established.

Combined daily sales of fluid whole milk in 21 Federal Order markets in 1950 were 2 percent larger than in 1949. This was the same percentage increase in daily sales that occurred between 1948 and 1949 for a slightly different group of markets (Minneapolis-St. Paul and New Orleans excluded). The increase in daily sales in 1950 over 1949 for a group of 5 markets for which in-area sales only are available was eight-tenths of one percent. The increase in 1949 over 1948 for this same group of markets (Boston, Fort Wayne, Kansas City, New York City, and Omaha-Council Bluffs) was four-tenths of one percent. The five market group is a small sample of the total group but the substantial difference in percentage sales gain seems to indicate that a larger growth in out-of-area sales than in-area sales occurred over this period.

Daily average sales of butterfat in fluid cream in twenty Federal Order areas in 1950 increased  $1\frac{1}{2}$  percent over 1949. 1949 sales in turn were two-tenths of one percent larger than in 1948. Daily average sales in 1950 were 2.5 percent greater than in 1948.

Daily average sales of skim milk items in 20 Federal Order areas in 1950 were 7 percent greater than in 1949. In 1949 the increase over 1948 was 9 percent. For a group of 5 markets for which in-area sales only are available the increase in 1950 over 1949 was 4 percent and the increase in 1949 over 1948 was also 4 percent. These markets are Boston, Fort Wayne, Kansas City, New York City and Omaha-Council Bluffs.

Considerable interest has been expressed from time to time in the variation among milk markets of the ratio of sales of fluid cream to total sales of fluid milk and fluid cream. Interest has also been expressed in the behavior of this ratio over a period of time for given markets. In order to throw some light on this subject a new table showing this information for the more important Federal Order markets for 1947-49 was constructed. It is planned to publish a similar table annually, adding one year and dropping one year to keep this information up to date.

Table 60 shows aggregate sales of butterfat in the form of fluid milk and fluid cream in 20 Federal Order markets for each of the years 1947-48 and '49. Sales of butterfat in fluid whole milk, in fluid cream and in fluid milk and cream mixtures were combined and the ratio of annual sales of butterfat in cream (and in milk and cream mixtures) to total sales of butterfat in all fluid forms was determined for each marketing area. Similar comparisons on a product weight or volume basis would be confusing because of variations among markets in the butterfat test of all items which make up the cream class viz. items testing from 6 percent to 40 percent butterfat.

The ratios show some evidence of decline for most of these marketing areas from 1947 to 1948. Further declines appear from 1948 to 1949 in all of the markets for which segregated in-area sales are shown except the Twin City market which was unchanged and the Omaha-Council Bluffs market which showed a small increase. It is impossible to assess accurately the changes which have occurred in those areas for which both in-area and out-of-area sales are combined.

The ratios show considerable variation among marketing areas. The northernmost markets show the highest ratios of fluid cream sales to total milk and cream sales with Minneapolis-St. Paul, Chicago and Boston leading in that order. The lowest ratios appear in the southern markets such as New Orleans, Nashville and Louisville. The ratios for those areas (8) for which in-area sales only are not available must be interpreted with reservations. Data for these areas have been included in the table because it is believed that they will be of interest to many readers in their present form.

Data for the New York City market were not included in the table because they do not include substantial quantities of storage cream used for fluid (sour) cream purposes. The New York area ratios on this incomplete basis are; for 1947, 15.3 percent; for 1948, 16.1 percent; and for 1949, 16.9 percent.

Table 62.- Per capita consumption of dairy products, U. S., 1909-1950 1/

Year	Total Pounds	Fluid milk: milk and cream Pounds	Butter Pounds	Cheese: 2/ Pounds	Evap- ated milk Pounds	Con- centrated milk Pounds	Dry densed milk Pounds	Dry whole milk Pounds	Skim milk Pounds	Cream milk Pounds	Ice Gallons

1/ Civilian consumption only 1941-50. Figures for total milk and fluid milk and cream for 1909-1923 period are tentative approximations only.

2/ Nonfarm and farm combined. Includes cream in terms of whole milk equivalent. Series subject to revision on basis of special studies now in progress.

3/ All cheese except full skim, cottage, pot and bakers'.

4/ Case and bulk.

5/ Less than .005.

6/ Not available.

percent in January, down to 3.74 percent in June. During October and November, the butterfat test was 4.09 percent and declined to 4.02 percent in December.

Price of milk purchased for use in American cheese averaged \$3.14 per hundredweight for 1950 compared with \$3.07 for 1949. Only during January were prices lower than a year earlier. For the remainder of the year, prices were higher than a year earlier. By December the price averaged \$3.69 per hundredweight or 43 cents above a year earlier. Butterfat tests ranged from 3.92 percent for January to 3.74 percent in June. The highest test was reached in November at 4.15 percent and in December dropped to 4.06 percent. Average price per pound of butterfat ranged from 81 cents in February to 77 cents in May, June, and July. By December, the price per pound had reached 91 cents.

Based on actual butterfat test, prices paid farmers for milk used by condenseries averaged \$3.34 per hundredweight for 1950 compared with \$3.24 for 1949. Prices were lower than a year earlier in January and February but higher during the rest of the year. The largest gain was in December when the price averaged \$3.95 per hundredweight, a gain of 48 cents from a year earlier. Butterfat tests were 4.19 percent in January and declined to 3.92 percent in May and June. The butterfat test reached its height in November at 4.36 percent. The price per pound of butterfat was 81 cents in February, declining to 77 cents in July, then rose to 91 cents for December. Prices paid by condenseries for milk of 3.5 percent butterfat averaged \$2.87 per hundredweight for the entire year of 1950 compared with \$2.81 for 1949. The price was \$2.84 for January and February and gradually declined to \$2.71 for June. It rose each month until the December price reached \$3.25 per hundredweight.
